

# RSA DATA LOSS PREVENTION DATACENTER

Take the first step in proactively protecting sensitive data and reducing risk

## AT-A-GLANCE

- Prioritize your security projects with the fastest and most accurate way to profile your risk across file shares, databases, storage systems (SAN/NAS), Microsoft SharePoint® sites and other data repositories.
- Use grid scanning technology to transform your existing servers into a powerful cluster to scan terabytes of data in parallel with no additional hardware and little set-up time
- Reduce risk through a rich set of automated actions such as move, quarantine, change access control, and eDRM encryption
- Identify sensitive information in collaborative environments such as Microsoft SharePoint®, Documentum® and Lotus Notes®

## Overview

Every day employees create and access millions of files that are stored across the infrastructure, often in file shares and large repositories, such as Microsoft SharePoint. With the amount of unstructured data doubling every year and proliferating across the enterprise, how do you ensure that your organization's most sensitive information is properly protected?

RSA® Data Loss Prevention (DLP) Datacenter helps you identify the location of sensitive data and enforce policies across file shares, databases, SAN/NAS storage, Microsoft SharePoint® sites and other data repositories to reduce the risk and business impact associated with data loss. RSA DLP even supports the scanning of cloud-based repositories, such as Microsoft SharePoint Online.

Your task is made easy with non-intrusive technologies, including temporary agents and RSA's exclusive grid-based scanning technology. What this means for you is the lowest total cost of ownership among all leading DLP solutions.

## Major Use Cases

- Identify the location of regulatory data and ensure it is properly secured to comply with regulations
- Ensure critical business data, such as intellectual property, product roadmaps, and company financial records is not stored unprotected on open-access file shares
- Visibility into the risk of sensitive data stored in cloud-based repositories, such as SharePoint Online

## Key Benefits

- Efficiently scan large data repositories to identify the risk of unprotected sensitive data.
- Reduce the scope of compliance regulations by proving which servers do not contain regulatory data
- Create a continuously updated risk map to help you identify gaps in your information security architecture
- Minimize impact to your administrative staff with the most intuitive and rich incident workflow and both automated and manual remediation options
- Reduce risk by establishing a repeatable workflow to involve file owners in remediating sensitive data uncovered in RSA DLP Datacenter scans.

DATA SHEET

EMC<sup>2</sup>

RSA®

“The unparalleled accuracy and unique features of RSA DLP Datacenter – such as incremental processing – made it the only viable choice for discovering all our sensitive content.”

Olav Opedal, Security Program Manager,  
Microsoft

## Grid-based Scanning

RSA DLP's exclusive grid-based scanning technology enables you to scan data at almost any speed required. Whether you need to meet an audit deadline or monitor incremental changes to your datacenter on a regular basis, RSA's grid scanning technology enables you to scan massive data repositories quickly and in parallel. Additional features include:

- **Dynamically add resources.** Use simple GUI-based controls to dynamically add or remove grid workers without interruption
- **Scalable.** Add any number of servers anytime to scan over 100TB of data
- **Resource sensitive.** Can automatically throttle CPU or network bandwidth usage depending on your needs
- **Minimize network traffic.** Grid servers can be deployed near your data, in multiple locations
- **Intelligent load balancing.** No need to micromanage your scan servers whenever one finishes its task
- **Low cost.** There is no need to purchase additional dedicated servers. Use idle servers you already have.

## Additional RSA DLP Datacenter Features

- **Scan numerous discovery targets.** Scan targets include file shares, databases, endpoints, virtual machines, Microsoft SharePoint®, Documentum®, SharePoint Online and other many over repositories.
- **Native scanning of SharePoint®, Microsoft Exchange, and Lotus Notes/Domino®.** There is no need to install an agent or extra software on the SharePoint, Exchange, or Domino server. Scanning is performed using standard, non-intrusive means. All configuration is accomplished centrally within the Enterprise Manager GUI.
- **Bring the software to the data, not the other way around.** Competitive solutions pull data back to central servers, saturating your network, or require you to install dedicated servers at remote locations. RSA Data Loss Prevention automatically deploys and manages software infrastructure to remote data centers, minimizing network traffic and administrative burden.
